Phone: (555) 555-5555
Fax: (555) 555-5555

Patient Name: **Sample, Patient**
Patient DOB / Sex: **01/01/1901 / F**
Specimen Type: **Paraffin Tissue**
Specimen ID: **X99-99**
MRN: **9999999**

Ordering Physician(s): **Sample Doctor, MD**
Accession / CaseNo: **9999999 / XXX99-999999**
Collection Date: **06/08/2020**
Received Date: **06/09/2020 08:13:00 AM PDT**
Report Date: **06/23/2020 08:13:00 AM PDT**

Results Summary

 4 Clinically Significant Variants Detected[§]	NRAS Q61R; TERT c.-146C>T; TP53 c.375+2T>G, F109Sfs*14
 Pertinent Negatives	NO abnormalities detected in the following genes: BRAF, RET
Interpretation	
- Dependent on tumor type, TERT mutations are often associated with a poor prognosis and aggressive disease. Clinicopathologic correlation recommended.	

[§] See full list of genes tested in Biomarkers Evaluated section at end of report.

Profile Results Detail

Molecular Testing Detail						
Gene name	Variant	Amino Acid Change	Nucleotide Change	Consequence	Mutant Allele Frequency (%)	Read Depth
NRAS	Q61R	p.Q61R	NM_002524.4: c.182A>G	nonsynonymous	58.1	1028
TERT	c.-146C>T	c.-146C>T	NM_198253.2: c.-146C>T	promoter	33.8	231
TP53	c.375+2T>G	c.375+2T>G	NM_000546.5: c.375+2T>G	splice site	34.5	1168
	F109Sfs*14	p.F109Sfs*14	NM_000546.5: c.326delT	frameshift	21.2	2108

FISH Testing Detail		
Test	Results	ISCN Data
RET FISH - STP	Not Detected (Atypical)	nuc ish(RETx1)[16/50]

Test Description & Methodology

Test Description
The NGS Thyroid Profile non-MTC uses next-generation sequencing (NGS) and FISH as listed below. Test orders include summary interpretation of all results to help guide treatment decisions.

Clinical Significance

The NGS Thyroid Profile non-MTC is useful to classify fine needle aspirates of thyroid nodules that are indeterminate or suspicious on cytology. Presence of mutations or gene rearrangements as detected by FISH predicts malignancy with varying degrees of specificity depending on the gene mutated and histological subtype. BRAF mutation V600E is associated with poor prognosis in papillary thyroid carcinoma (PTC).

Methodology

Nucleic acid is isolated from paraffin-embedded tissue (FFPE) or fresh cells. Testing for NGS Thyroid Profile non-MTC is performed using Next-Generation Sequencing (NGS) of the coding DNA of the listed genes. This includes sequencing of all the exons. An additional 50 nucleotides at the 5' and 3' ends of each coding exon are also sequenced to detect important splicing abnormalities. The NGS method has a typical sensitivity of 3% for detecting common specific mutations and 5% for other mutations. If TERT Gene Promoter is ordered, PCR product is purified and sequenced in both forward and reverse directions and analyzed using GenBank Acc# NG_009265.1. Both -146 C>T or -124 C>T hotspot mutations are reported. This assay has a typical sensitivity of 10-15% for detecting mutated TERT Promoter DNA in a wild-type background. Various factors including quantity and quality of nucleic acid, sample preparation, and sample age can affect assay performance. If FISH or IHC testing is ordered, please see individual reports for description of testing.

Biomarkers Evaluated (by molecular analysis unless otherwise noted)

AKT1, ALK, ARID1A, ATM, BRAF, CDKN2A, CTNNB1, ERBB2, ERBB4, HRAS, KRAS, MEN1, MET, NF1, NF2, NRAS, PIK3CA, PTEN, RET, RET FISH, SMAD4, SMO, SRC, TERT Promoter, TP53, TSC1, TSC2
